Project Overview

Project Description
DadPath is a web application designed to help expecting fathers prepare for parenthood through personal journaling, financial planning, and a centralized dashboard.

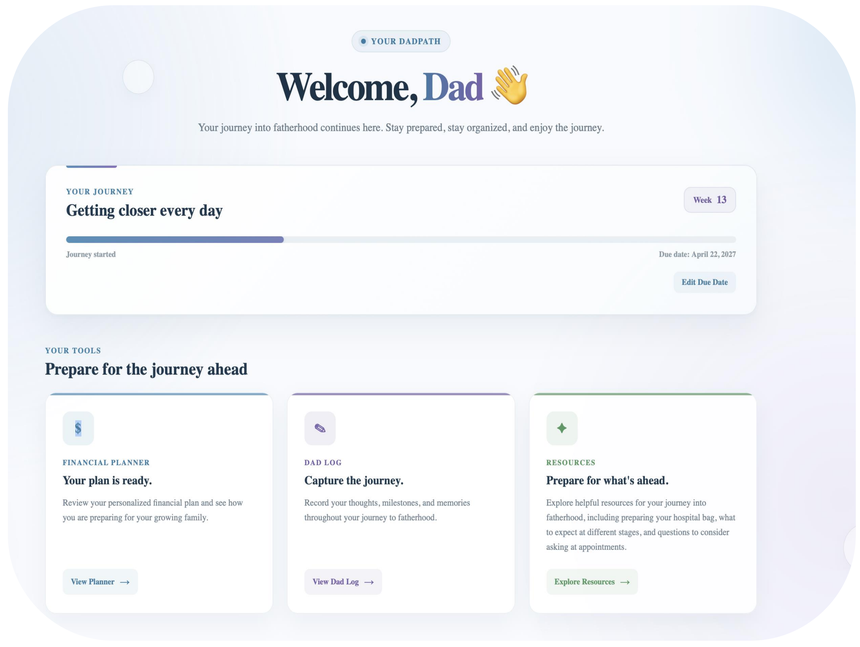

Project Justification
The transition to fatherhood brings new financial and personal responsibilities. DadPath provides accessible tools to help expecting fathers organize their preparation and approach parenthood with greater confidence.

Technical Design

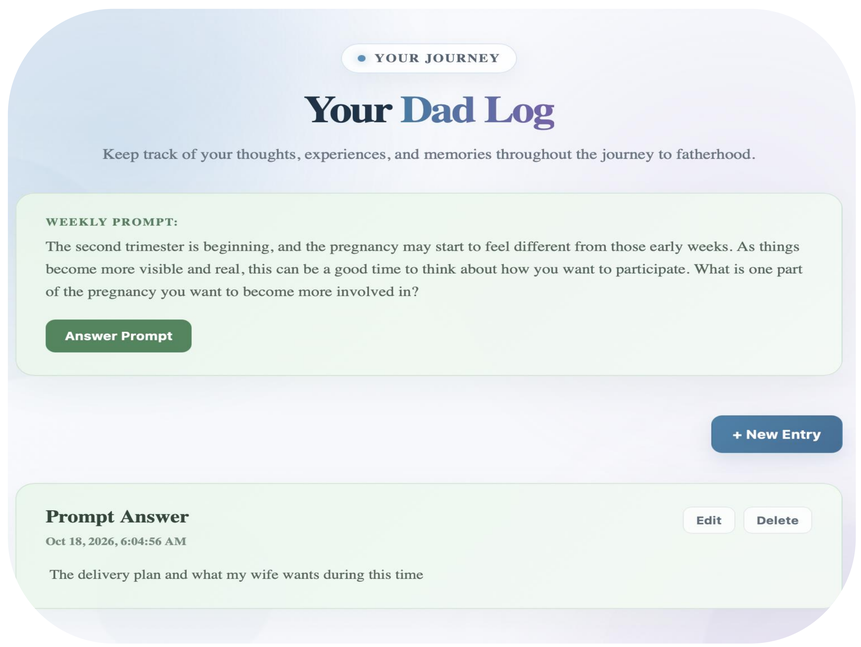

Functional Requirements & Specifications
- ***Authentication:*** Secure user registration and login
- ***Dashboard:*** Centralized access to application tools
- ***Dad Log:*** Personal reflection and journaling
- **Financial Planner:** Interactive financial planning with personalized results
- ***Technology Stack:*** Angular, Spring Boot, Java, and PostgreSQL
- ***Security:*** JWT authentication and BCrypt password hashing

Design Process
DadPath followed an Agile-inspired iterative development approach, progressing through requirements analysis, interface and backend design, implementation, testing, and deployment. Frontend and backend components were developed and integrated incrementally to validate functionality.

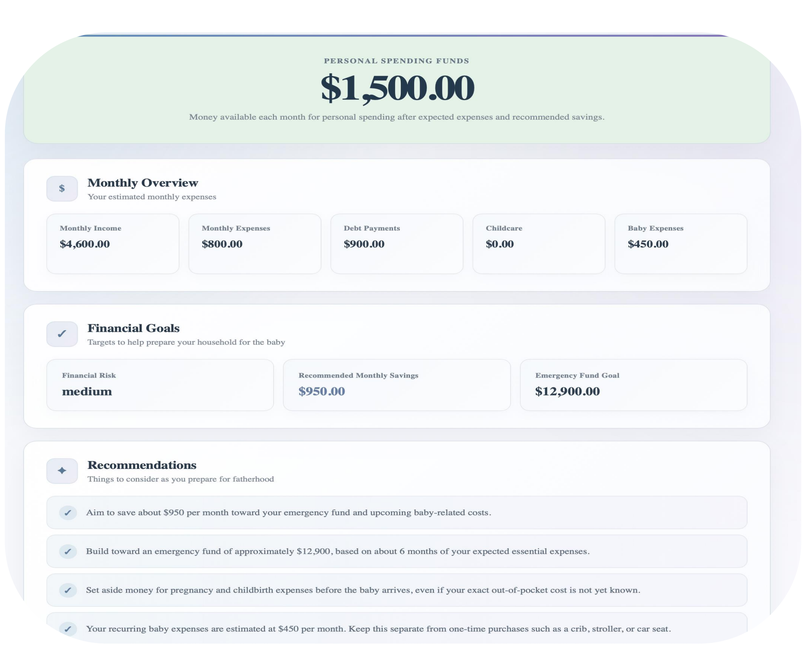

Results & Demonstration

Dashboard
Central navigation and application overview

Dad Log
Personal reflection interface

Financial Planner
Financial planning personalized results

Testing & Validation

The application was evaluated using documented module test cases and a requirements traceability matrix to assess core functionality

17
Documented test cases

Deployed
Vercel + Railway
